EXPERIMENT 4

Reports in Zoho Creator

1. Aim

To explore the report features available in Zoho Creator and present stored student information through suitable views that make records easier to read, organize, and interpret.

2. Introduction

Reports in Zoho Creator provide different ways to display information collected through forms. Depending on the nature of the data, records can be arranged as tables, maps, timelines, categorized views, or graphical representations. This helps users access the required information without changing the original form data.

3. Objectives of the Study

- To understand the role of reports in a low-code application.
- To create meaningful views from existing application records.
- To select report formats according to the type of information available.
- To configure and verify report fields and display settings.
- To examine how different views improve the presentation of stored records.

4. Procedure

1. Open the Student Management System application in Zoho Creator.
2. Choose the form containing the records to be presented.
3. Create a report and select an appropriate report format.
4. Select the fields required for display.
5. Configure sorting, filtering, grouping, or other display options where needed.
6. Use sample records to check the report output.
7. Preview the report and verify the displayed information.
8. Repeat the process for other report formats and compare their usefulness.

5. Report Types Demonstrated

- List Report: Displays records in a row-and-column arrangement, which is useful for viewing several student entries together.
- Map Report: Represents location-based records on a map and is useful for information containing addresses or locations.
- Timeline Report: Places records along a time scale, making date-based information easier to follow.
- Kanban and Chart Views: Other available views can organize records by categories or present numerical information visually.

6. Implementation and Output

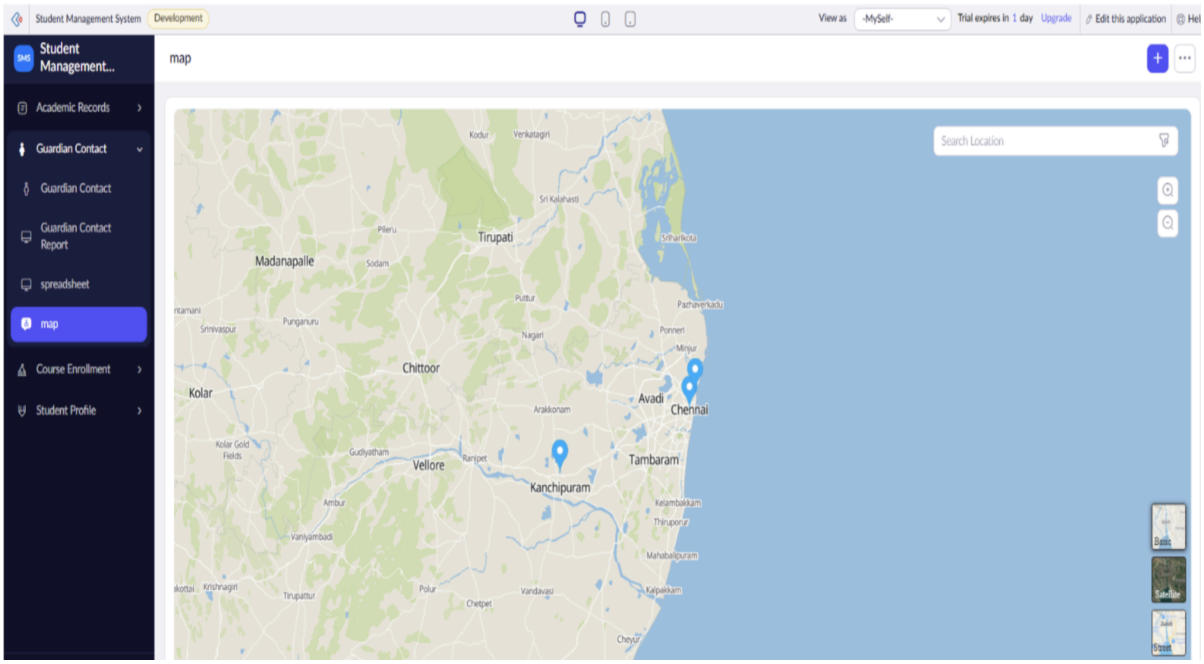

Figure 1: Academic Records Report displaying student academic information.

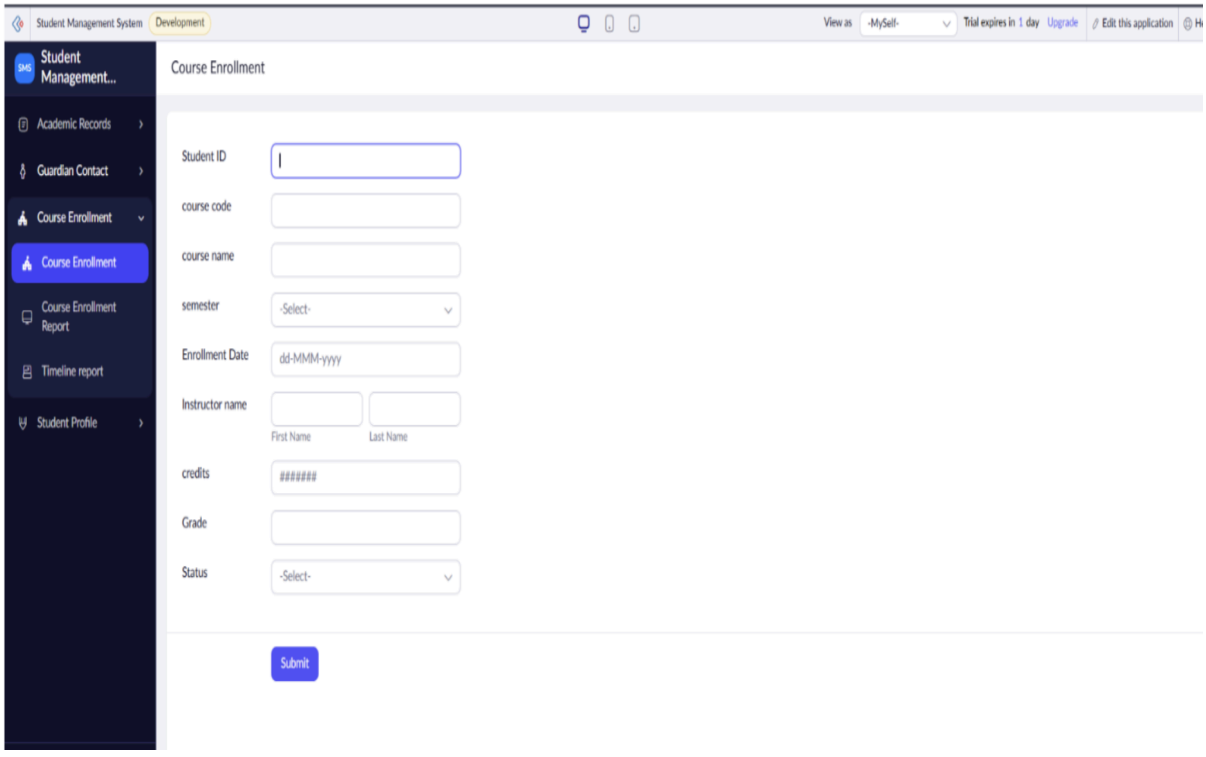

Figure 2: Map view showing location-based records.

7. Additional Report Views

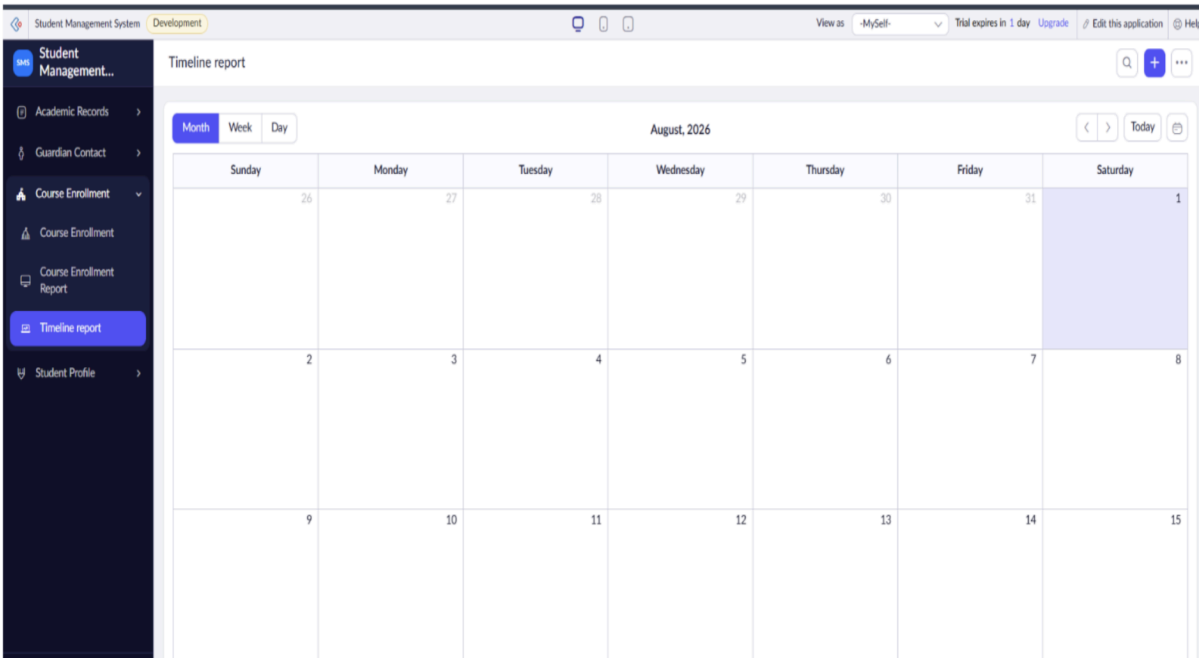

Figure 3: Course Enrollment form used for presenting course-related records.

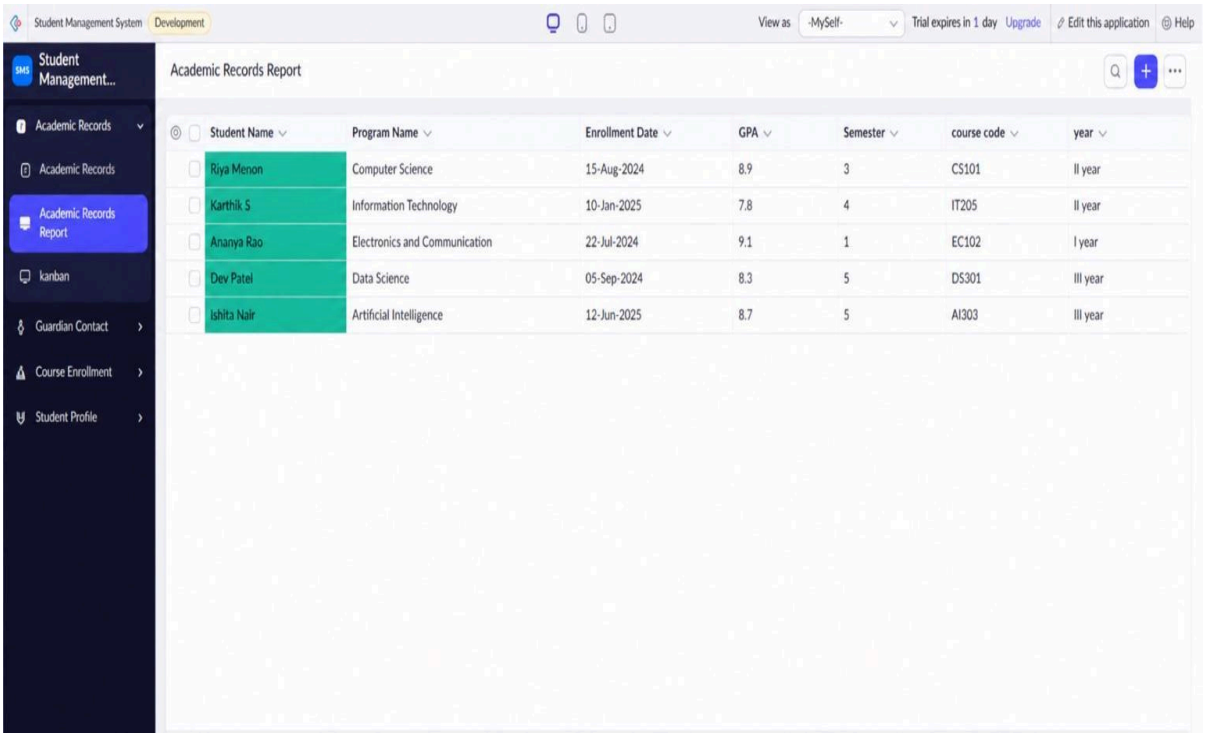

Figure 4: Timeline report displaying information across a calendar view.

8. Advantages

• Provides multiple ways to view the same stored data.
• Makes large sets of records easier to browse and understand.
• Allows information to be arranged according to categories, dates, or locations.
• Helps users find required records more efficiently.
• Report layouts can be configured to suit the application's needs.

9. Result

The required report views were successfully explored using the Student Management System in Zoho Creator. The experiment demonstrated how different report formats can be used to present stored records clearly and make application data easier to access and analyze.
