EXPERIMENT 5
Dashboard in Zoho Creator

1. Aim

To design and examine a dashboard in Zoho Creator that brings important study-planning information together in a single visual interface using summary cards, status indicators, quick actions, and charts.

2. Introduction

A dashboard in Zoho Creator acts as a central screen for viewing important information from an application. Instead of opening each form or report separately, related information can be combined into one page. Dashboard elements such as summary panels, charts, status indicators, and quick links allow users to understand the current state of the application at a glance.

3. Objectives of the Study

- To understand the purpose of dashboards in a low-code application.
- To combine information from different study-planning modules in one view.
- To display important values using summary cards and visual charts.
- To provide quick access to frequently used application actions.
- To verify that the dashboard presents stored records in a clear and useful manner.

4. Application Used

The Student Study Planner application is used for this experiment. It contains modules such as Study Tasks, Strategy Usage, Pomodoro Sessions, Study Notes, Flashcards, and other study-related records. The dashboard combines selected information from these modules into a single screen.

5. Procedure

1. Open the Student Study Planner application in Zoho Creator.
2. Ensure that the required study-related forms contain sample records.
3. Create a dashboard within the application.
4. Add summary components to display important counts and calculated values.
5. Configure a status section to show the current distribution of study tasks.
6. Add quick links for commonly used actions such as creating study tasks and recording Pomodoro sessions.
7. Insert charts to represent focus and study-category information visually.
8. Arrange the components neatly and preview the dashboard to verify the final output.

6. Dashboard Components

The dashboard contains several elements that provide a consolidated view of the study planner:

- Summary Cards: show values such as Average Ease Factor, number of Study Tasks, Strategy Usage entries, and Pomodoro Sessions.
- Study Status: presents the number of tasks in states such as Not Started, Completed, In Progress, and Postponed.

• Quick Links: provide direct access to adding Study Tasks, Strategy Usage, Pomodoro Sessions, and Study Notes.
• Focus Level Chart: represents focus levels against the recorded duration in minutes.
• Category Chart: compares study categories according to their recommended duration.

7. Dashboard Output

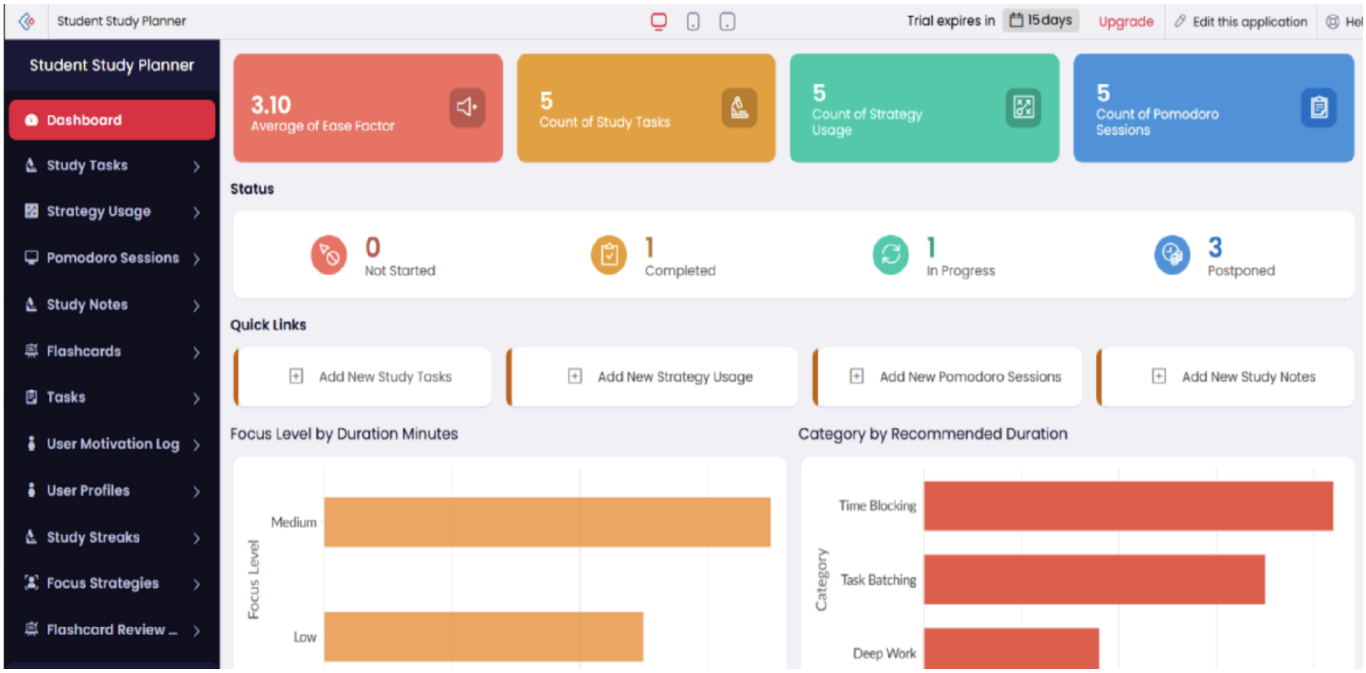

Figure 1: Student Study Planner dashboard showing summary cards, task status, quick links, and charts.

8. Dashboard Records

The dashboard is supported by stored application records. The Pomodoro Sessions report contains session ID, start and end time, duration, completion status, focus level, task, and user information. These records provide the underlying data used by the application and can be accessed from the related module.

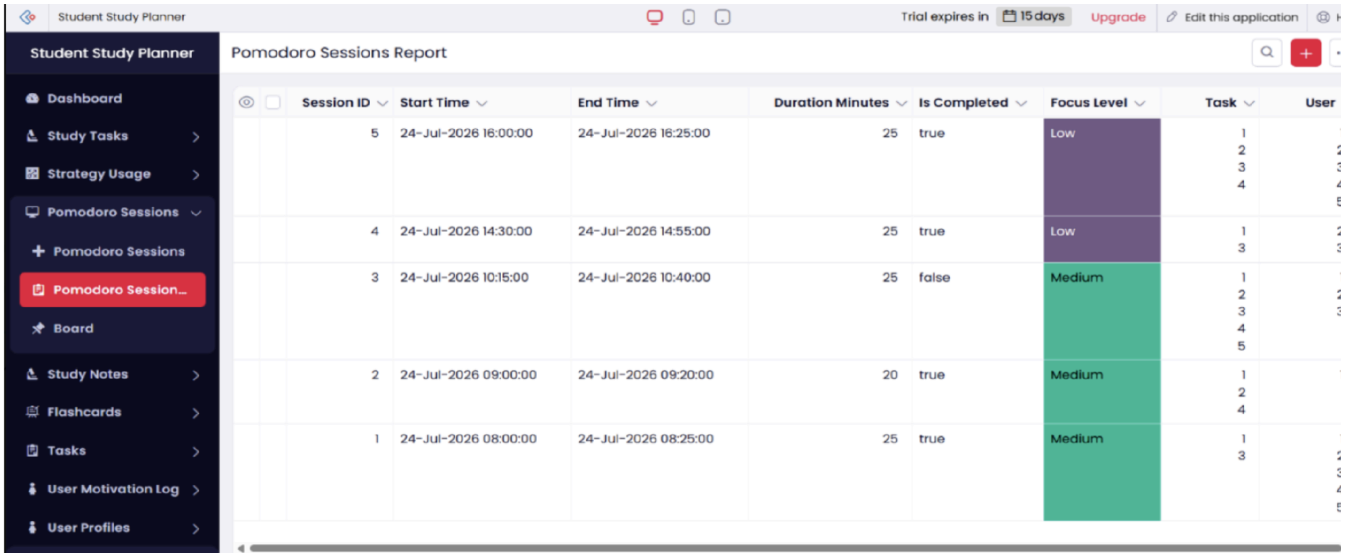

Figure 2: Pomodoro Sessions report containing the records used by the study-planning application.

9. Advantages

• Brings information from multiple application areas into one screen.
• Makes important statistics easier to identify quickly.
• Charts provide a visual way of understanding study-related data.
• Quick links reduce the number of steps needed to perform common actions.
• The dashboard can be customized according to the application's requirements.

10. Result

A Student Study Planner dashboard was successfully configured in Zoho Creator. The completed dashboard combines summary information, task status, quick actions, and graphical views, while the related Pomodoro records provide the underlying study-session data. The experiment demonstrates how a dashboard can act as a single point for monitoring application information.
