EXPERIMENT 7
User, Roles and Permissions in Zoho Creator

1. Aim

To configure users, roles, and permission sets in Zoho Creator and understand how application access can be controlled for different categories of users.

2. Introduction

Zoho Creator provides access-control features that allow an application owner to organize users into roles and assign permissions according to their responsibilities. Roles help define what a user can access, while permission sets can provide access to selected application components. This helps separate administrative access from regular application use.

3. Objectives of the Study

- To understand the purpose of users, roles, and permissions in Zoho Creator.
- To create different roles for users with different responsibilities.
- To configure suitable access for selected application components.
- To assign users to the appropriate roles.
- To verify that access can be managed according to the assigned role.

4. Application Used

The Student Study Planner application is used for this experiment. It contains study-related modules such as tasks, notes, flashcards, and study sessions. Different roles are configured so that access to these application components can be managed according to user responsibilities.

5. Procedure

1. Open the Student Study Planner application in Zoho Creator.
2. Open application settings and navigate to Users and Permissions.
3. Review the available permission and role options.
4. Create roles for the required categories of users.
5. Configure permissions associated with the roles.
6. Assign users to the appropriate role.
7. Verify the role hierarchy and assigned permissions.
8. Review the final user and role configuration.

6. Output and Configuration

6.1 User Roles and Permissions

The Users and Permissions area provides controls for managing application access. Roles can be created for different responsibilities, with permissions used to control access to application components.

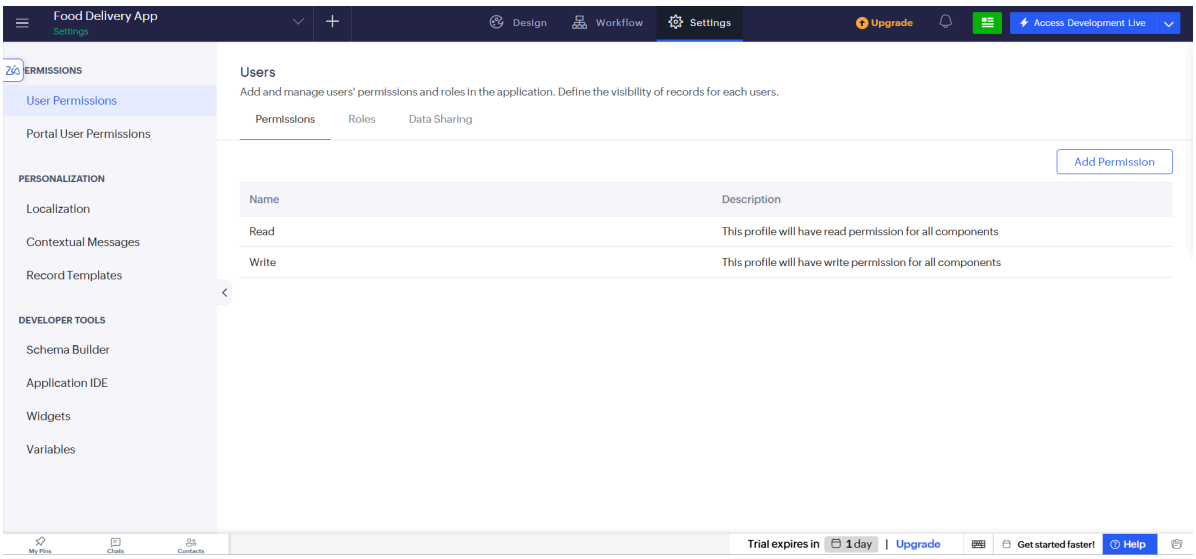

Figure 1: Users and Permissions section showing the available access-control configuration.

6.2 Administrator Role

The Administrator role is configured with broad access for managing the application and its components. It is intended for application-level administration.

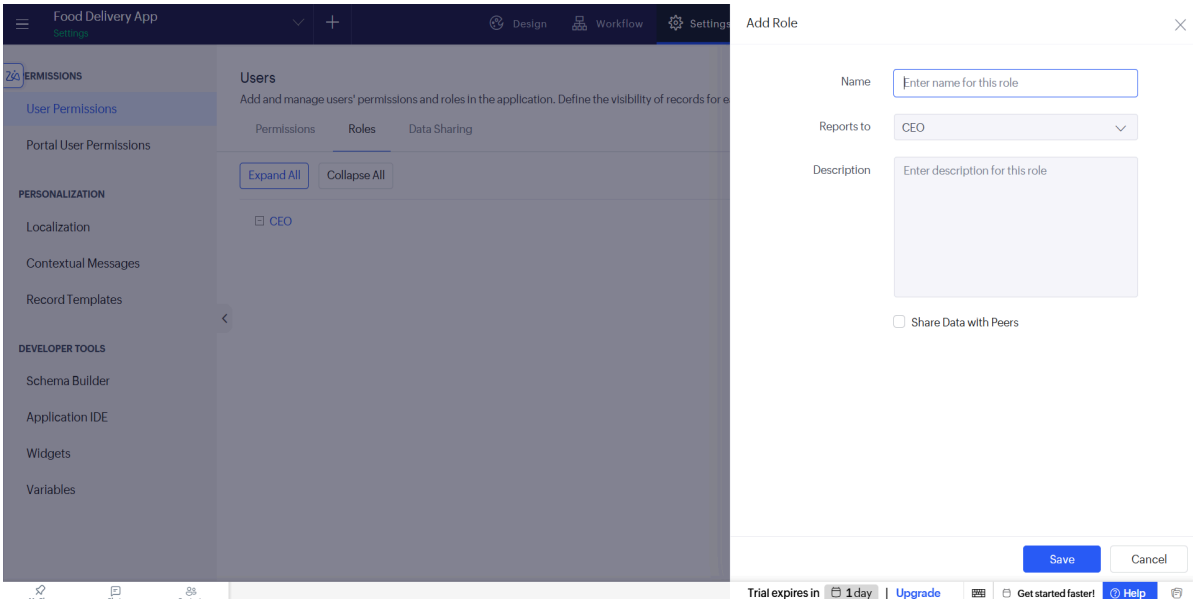

Figure 2: Administrator role being added in the application.

6.3 Study Manager Role

The Study Manager role is intended for managing study-related records such as tasks, notes, flashcards, and study sessions.

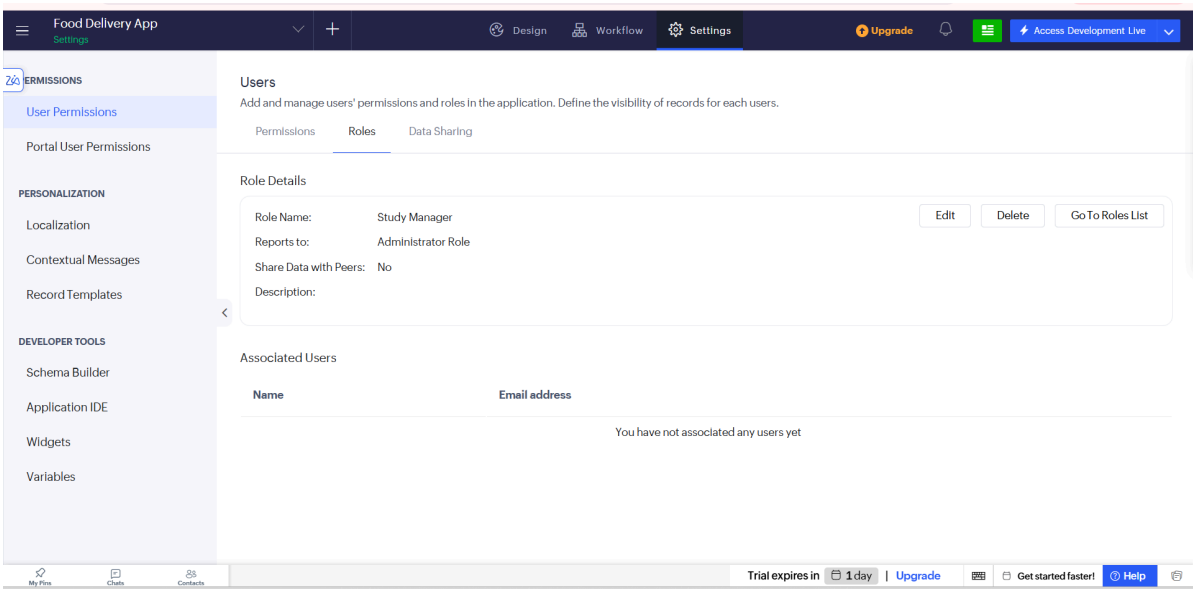

Figure 3: Study Manager role configuration and details.

6.4 Student Role

The Student role provides the access needed to view and work with study-related information without providing the same administrative scope as the administrator.

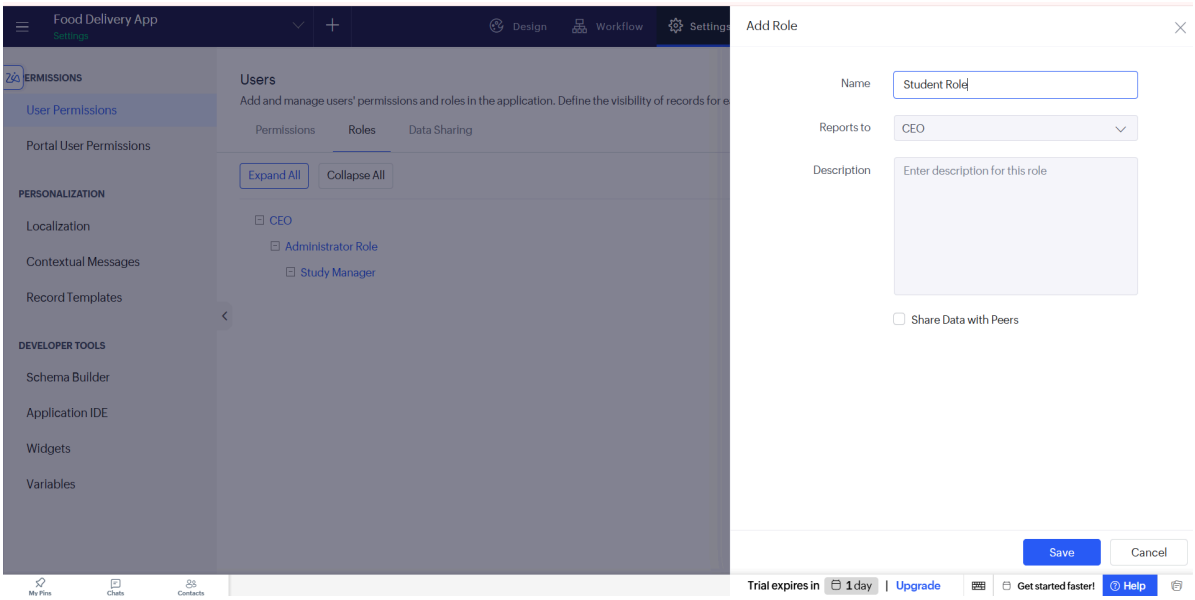

Figure 4: Student role configuration.

6.5 Study Assistant Role and Permission Set

A Study Assistant role is configured for selected study-related activities. A permission set can then be used to provide the required access to application components.

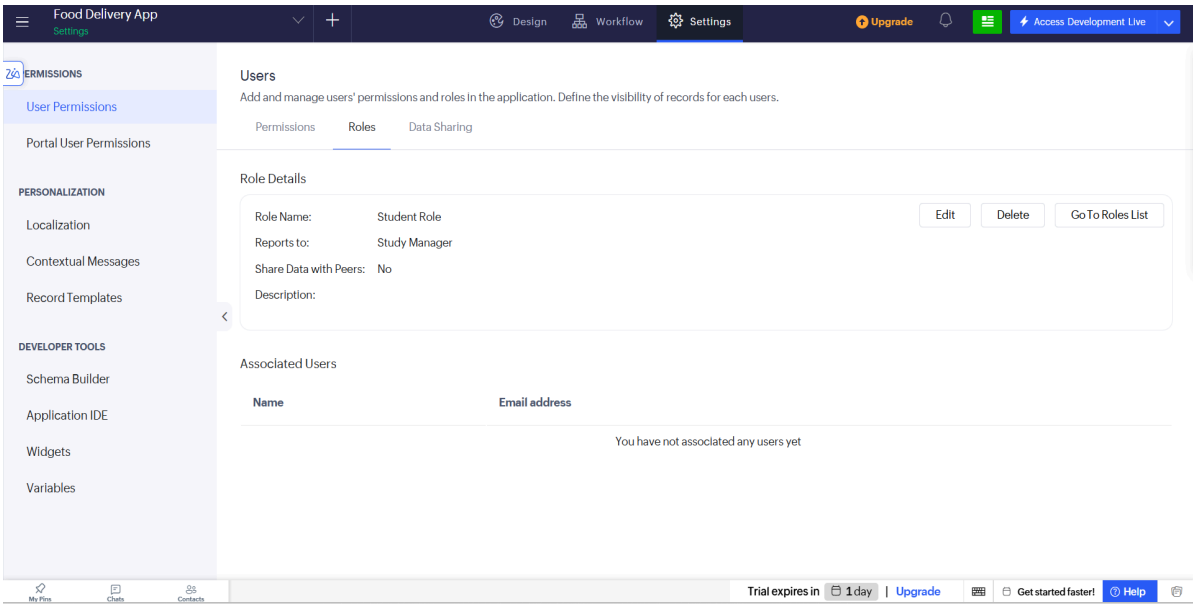

Figure 5: Study Assistant role and permission configuration.

6.6 Study Manager Permission and User Assignment

The Study Manager permission configuration is applied to selected application modules. A user can then be associated with the suitable role and permission set.

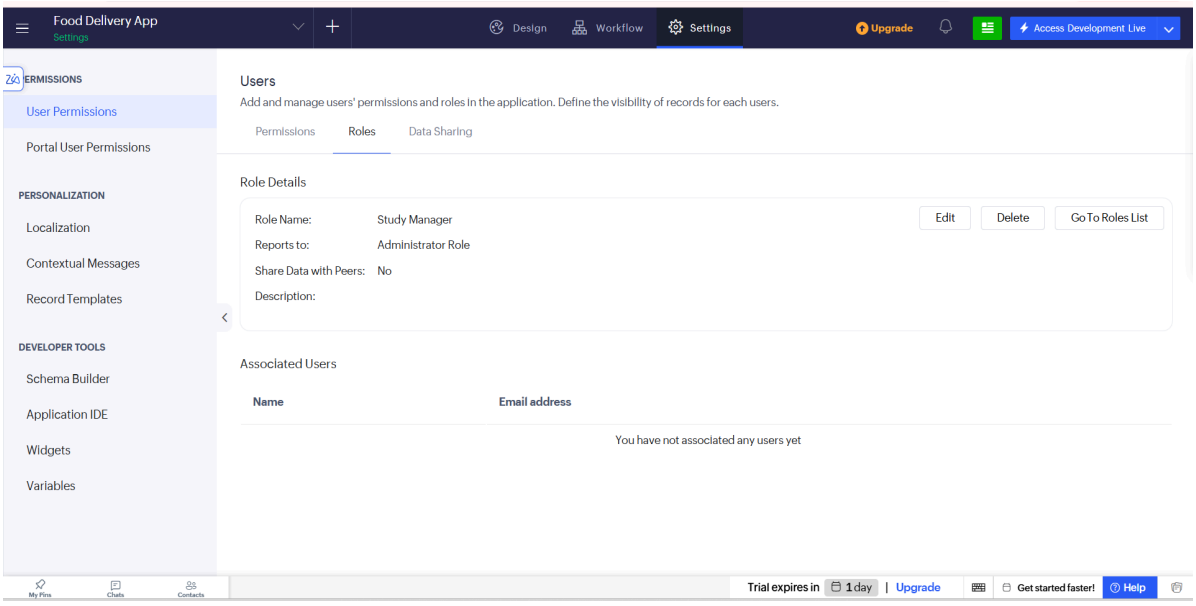

Figure 6: Study Manager permission configuration and user assignment.

6.7 User List

The Users section provides an overview of the configured role hierarchy and the users associated with the application.

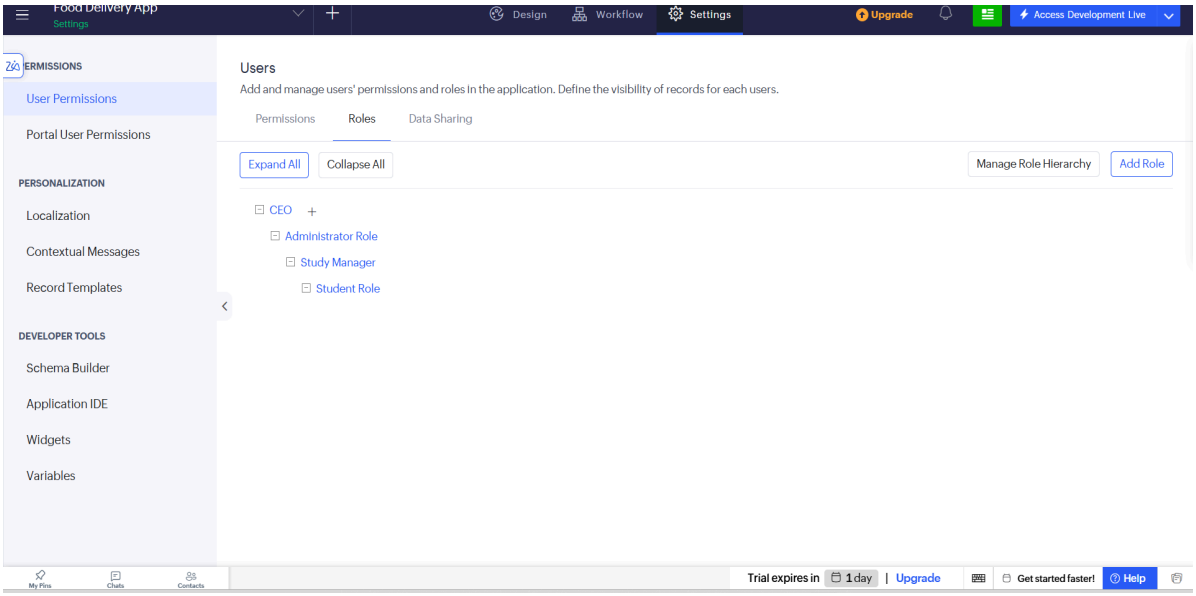

Figure 7: User and role hierarchy displayed in the Users section.

7. Result

Different user roles and permission settings were successfully configured for the Student Study Planner application in Zoho Creator. The experiment demonstrated how application access can be organized according to the responsibilities assigned to different users.
