CB23F35: Low-Code Application Development using Zoho Creator

EX. 8: Workflow Automation Using Zoho Creator

1. AIM

To create and test a workflow in Zoho Creator that automatically performs an action when a selected event and its conditions are satisfied.

2. INTRODUCTION

Workflow automation in Zoho Creator helps an application respond to changes in its data without requiring users to perform every step manually. A workflow can be triggered when a record is added or updated, when a field action occurs, or at a scheduled time. Depending on the configuration, it can update fields, send notifications, or run Deluge logic.

3. OBJECTIVES

- To identify suitable events that can trigger an application workflow.
- To configure conditions that determine when an action should execute.
- To automate routine tasks using notifications, field updates, or Deluge scripts.
- To test the workflow with sample records and check the resulting behaviour.
- To understand how automation improves consistency and reduces manual effort.

4. PROCEDURE

- Sign in to Zoho Creator and open the application to be configured.
- Open the Workflow section and select the option to create a new workflow.
- Provide a meaningful name and a short description for the workflow.
- Choose the form or component that will be associated with the workflow.
- Select the event that should trigger the workflow, such as adding or editing a record.
- Define any criteria that must be met before the workflow runs.
- Choose an action, for example sending an email, updating a field, or executing a Deluge script.
- Configure the selected action and save the workflow.
- Add or edit a sample record to trigger the workflow.
- Check the record and notification details to confirm that the workflow behaved as expected.

5. COMMON WORKFLOW TRIGGERS

Trigger	Purpose
On record addition	Starts when a new record is submitted through a form.
On record update	Runs when an existing record is edited and saved.
On record deletion	Can perform configured actions when a record is deleted, where supported.
Scheduled trigger	Executes an action at a configured date, time, or interval.
Field-based action	Runs in response to a configured field event or user interaction.

6. ACTIONS AVAILABLE IN A WORKFLOW

- **Email notification:** Sends a message when a configured event occurs.
- **Field update:** Changes a field value automatically based on the workflow criteria.
- **Deluge script:** Executes custom logic to validate data or perform application-specific operations.
- **Record action:** Performs supported operations on application records.
- **User notification:** Alerts relevant users about an event or pending task.

7. APPLICATION

In a Student Study Planner application, a workflow can be configured to notify a student when a task is approaching its due date. Another workflow could update a task status when the student marks it as completed. For example, when a new task is added with a high priority, the application can send a notification or set a reminder field according to the configured conditions.

8. OUTPUT

The workflow is configured by selecting a trigger, specifying the required conditions, and defining the action to be performed. Evidence of the output can include the workflow setup screen, trigger selection, condition configuration, action settings, and the result obtained after testing with a sample record.

9. RESULT

Thus, a workflow in Zoho Creator was studied and its configuration process was documented. The experiment demonstrates how event-based actions and conditions can automate repetitive application tasks and improve the reliability of routine operations.
